#### ABSTRACT

Nearly 4.3 million workers held two jobs or more at the same time in May 1973, representing 5.1 percent of employed persons. After a 1972 decline, 1973 saw an increase of 500,000 wore moonlighters. Four-fifths of all moonlighters were men. The difference between the multiple job-holding rates of Negro and of white workers was not statistically significant. Men whose primary jobs were as teachers below the college level or as protective service workers had the highest moonlighting rates. Men who were postal workers on their first jobs also had a high multiple job-holding rate. Most male multiple jobholders held a full-time job while working at a second job, but female moonlighters were about equally divided between those who had two part-time jobs and those who had a full-time and a part-time job. A major part of the document is devoted to supplementary tables. (NW)

KOPP MICHELOTTI

# Multiple jobholding in May 1972 and 1973

NEARLY 4.3 MILLION WORKERS held two jobs or more at the same time in May 1973. Although this was the highest number of multiple jobholders ever recorded, the multiple jobholding rate—the proportion of all employed persons with more than one job—at 5.1 percent, was about the same as in most recent years in which surveys were made. (See table 1.) In the past decade, the multiple jobholding rate generally has fluctuated within the narrow range of 4.9 to 5.2 percent except for 1972, when it dropped to 4.6 percent.

This report, one in the series of Special Labor Force Reports, presents data from the latest survey of multiple jobholding, conducted by the Bureau of the Census for the Bureau of Labor Statistics. For purposes of this survey, multiple jobholders are defined as those employed persons who, during the survey week, (1) had jobs as wage or salary workers with two employers or more; (2) were self-employed and also held wage or salary jobs; or (3) worked as unpaid family workers but also had secondary wage or salary jobs. The primary job is the one at which the greatest number of hours were worked.<sup>2</sup>

Persons employed only in private households (as a maid, laundress, gardener, babysitter, and so on) who worked for two employers or more during the survey week were not counted as multiple jobholders because working for several employers was considered an inherent characteristic of this type of work rather than an indication of multiple jobholding. Also excluded were self-employed persons with additional farms or businesses, and persons with second jobs as unpaid family workers.

#### Trends

In 1973, there were 500,000 more multiple jobholders than a year earlier, when there had been a decline. Most of the 1972 decline and the

ERIC rint 2972

1973 upturn in the number of multiple jobholders was among workers holding two nonagricultural wage and salary jobs, particularly those whose first jobs were in durable goods manufacturing, construction, and public administration. More than half of all moonlighters held two nonagricultural wage and salary jobs in 1973. With the exception of the decline in 1972, this number has held steady around 2.3 to 2.4 million since 1969.

Another one-fifth of multiple jobholders combined nonagricultural wage and salary jobs with self-employment in nonfarm businesses. This accounted for 865,000 workers, essentially the same number as in 1971 and 1972.

Almost one-fourth of the multiple jobholders had at least one job in agriculture. The number, 1 million, was higher than in 1971 and 1972, but about the same as in the mid-1960's when a greater number of moonlighters had their principal job in agriculture. In 1973, most—7 out of 10—had primary jobs as wage and salary workers in the nonagricultural sector and operated their own farms as a second job. (See table 2.) The proportion of moonlighters with an agricultural job reached its peak in 1964 at 29 percent. Since 1969, the percentage of multiple jobholders with one job or more in agriculture has been relatively steady between 21 and 23 percent.

#### Demographic factors

Four-fifths of all moonlighters in May 1973 were men. The multiple jobholding rate of men continued to be much higher than that of women—6.6 percent compared with 2.7 percent. However, women's multiple jobholding rate in 1973 was somewhat higher than in most previous years. From 1962 to 1973, the proportion of

Kopp Michelotti is a social science research analyst in the Division of Labor Force Studies. Bureau of Labor Statistics.

multiple jobholders who are women has increased from 14 to 20 percent. This results from two factors: their somewhat higher multiple jobholding rate beginning in 1971 and the more rapidly growing number of women than men in the labor force.

Nevertheless, multiple jobholding remains primarily a male activity. At almost every age level, men have higher rates of multiple jobholding than women. The highest rates are among men in the prime working ages, as the following tabulation of multiple jobholding rates indicates:

Age	Men	Women
16 years and over	6.6	2.7
16 and 17 years	3.6	2.6
18 and 19 years	4.4	2.7
20 to 24 years	5.5	2.8
25 to 34 years	7.6	2.9
35 to 44 years	8.4	2.6
45 to 54 years	6.9	2.7
55 to 64 years	5.0	2.7
65 years and over	3.4	2.0

Among women, there are no significant differences by age in the frequency of multiple jobholding.

Married men have higher multiple jobholding rates than others—7.3 percent compared with 4.3 percent for single men and 4.2 percent for widower, divorced, and separated men. However, among women, the rate of multiple jobholding is lower for those married: 2.3 percent of married women compared with 3.2 percent of other women held more than one job.

Men are likely to have their strongest commitment to the world of work and to have their greatest need for income when they are 25 to 54 years old. Many men in these ages have families. and, especially for those at the younger end of this age range, their income from their primary vocations may not yet have reached its highest level. Mortgage debt and other expenses are likely to weigh most heavily on families in the middle of the worklife cycle. Thus, the frequency of multiple jobholding reaches a high of 9.2 percent among married men 35 to 44 years old. In contrast, married women have low multiple jobholding rates, probably because they still bear most of the responsibility for childrearing and household management, even when they work.

In the last few years, the multiple jobholding rate of Negro<sup>2</sup> men had been lower than that of white men. But in 1973 the rate for black men increased sharply to 6.0 percent, not significantly

different from the 6.7 percent rate for white men. The rate of black women (3.0 percent) continued to parallel the rate of white women (2.7 percent).

#### Occupation and industry

Among men, those with primary jobs as teachers below the college level were more likely to moonlight than those in other occupations. (See table 3.) Protective service workers, such as fire fighters and police, had the next highest multiple jobholding rate. Both these jobs generally involve hours different from the standard workday.

In terms of industry, the highest rates were among men with primary jobs in State and local government and educational services, reflecting, in part, the high rates of protective service workers and teachers. (See table 4.) Postal service workers also had a high rate. In contrast, men self-employed in nonagricultural industries had one of the lowest rates. It is probably easier for the self-employed to extend the hours they work on their primary jobs than to seek wage and salary jobs elsewhere.

Men who moonlighted usually held second jobs

in industries different from those of their first job. For instance, on first jobs, only 4 percent of the multiple jobholders were self-employed farmers and 4 percent were self-employed in other businesses. Yet well over a third of male multiple jobholders were self-employed on their second jobs—20 percent in farming and 17 percent in other businesses. Though a quarter of the moonlighters worked in manufacturing on their primary jobs, only 5 percent found second jobs in manufacturing. Another 11 percent had jobs in educational services as first jobs compared with 5 percent on second jobs. Thirteen percent moon-

lighted in retail trade, but only 8 percent had first jobs in retail trade.

There was somewhat more correspondence between the industries of primary and secondary jobs among women moonlighters. Forty percent of the women had second jobs as wage or salary workers in services, compared with 46 percent employed in services on primary jobs. Twenty-five percent had second jobs in retail trade and 20 percent had first jobs in this field. However, among moonlighting women, nonfarm self-employment was more important as a source of extra income than as a first job—15 percent of these

<sup>5</sup> Self-employed persons with a secondary business or form, but no wage or safery lob, were not counted as multiple jobholders.

multiple jobholders only if they also held a wage or salary jeb.

NOTE: Dashes indicate no persons in that category.

<sup>\*</sup> Fertons whose primary job was as an unpaid family worker were counted so

women were self-employed in nonfarm businesses on their second job but only 4 percent on their first job.

In terms of occupation, over one-fifth of male moonlighters were farmworkers on their second job. Fifteen percent were professionals, and managerial, craft, and service occupations each accounted for an additional tenth

A fifth of the women moonlighters had second jobs in clerical occupations and another fifth in Ervice occupations. An additional 18 percent had professional jobs, and 14 percent sales jobs.

Moonlighters generally do not perform the same kind of work on their second jobs as on the first. Except for professionals, in only three major occupation groups—clerical, service, and farm labor—were as many as 30 percent of the moonlighters employed in the same occupation group

on their second jobs as on their first. However, among those who were professionals on their primary jobs, a majority were employed as professionals on their second jobs.

The predominance of farming in multiple jobholding is illustrated by the fact that moonlighters with first jobs in four different major occupation groups are more likely to be farmers on their second jobs than any other major occupation. About a quarter of operatives, excluding transport equipment, and of managers and administrators were farmers on their second jobs. About 30 percent of transport equipment operatives and of craft workers were farmers on their second jobs.

Similarly, moonlighters with primary jobs in four nonagricultural industries—construction, manufacturing, transportation and public utilities, and wholesale trade—were more likely to have

anaid family workers		(6)	T.i	(5)	14	2.7	1 16	(1)			

<sup>&</sup>lt;sup>2</sup> Persons holding 2 jobs or more as percent of total employed in each industry. Total employed is sum of single job: Jiders and those holding 2 jobs or more whose arimary job is in that industry.

as multiple jobholders.

NOTE: Deshes indicate no persons in that category.

secondary jobs in agriculture than in any other industry, primarily as self-employed workers. In only two nonagricultural industries, retail trade and services, were moonlighters more likely to be employed in the same industry on the second job than in any other industry. The service industry encompasses a broad range of activities so that even here correspondence between primary and secondary jobs may be small.

#### Hours of work

ERIC

Most male multiple jobholders held a full-time job while working at a second job, but about as many women moonlighters had two part-time jobs a full-time and a part-time job. Three-

quarters of male multiple jobholders worked full time on their primary jobs and part time on their secondary jobs. 18 percent had two part-time jobs, and 7 percent had two full-time jobs. About half of the female moonlighters had two part-time jobs, 45 percent combined a full-time with a part-time job, and 4 percent worked at two full-time jobs. A majority of moonlighters worked less than 15 hours a week on their secondary jobs. Men worked an average of 14 hours at their extra jobs during the survey week while women worked 11 hours.

Moonlighters with second jobs in agriculture, manufacturing, and transportation and public utilities worked the longest hours at second jobs: at least a fourth of the moonlighters in these industries worked 22 hours or more a week. Those

<sup>\*</sup> Persons whose only extra job was as an unpoid family worker were not counted

<sup>\*</sup> Rate not shown where bese is less than 75,000.

with second jobs in finance, insurance, and real estate, in services, and in public administration worked the shortest hours. Over a third of the moonlighters in these industries worked less than 8 hours a week.

By occupation, those who moonlighted as farmers and operatives worked the longest hours at second jobs; professionals and nonfarm laborers worked the shortest hours. Nearly a third of moonlighters who were operatives, excluding transport equipment, and farmers worked 22 hours or more during the week at second jobs. A quarter of transport equipment operatives worked that long. In contrast, only 8 percent of professionals worked that many hours. About 44 percent of professionals and 36 percent of nonfarm laborers worked fewer than 8 hours during the survey week at these secondary jobs.

#### ---FOOTNOTES----

- ¹ Data in this report are based on information from supplementary questions attached to the monthly survey of the labor force, conducted for the Bureau of Labor Statistics by the Bureau of the Census through its Current Population Survey. The data relates to the weeks of May 7–13, 1972, and May 6–12, 1973. For the most recent report in this series, see Howard Hayghe and Kopp Michelotti, "Multiple Jobholding in 1970 and 1971," Monthly Labor Review. October 1971, pp. 38–45, reprinted with additional tabular data and explanatory notes as Special Labor Force Report 139.
- \* Also included as multiple jobholders are persons who had 2 jobs during the survey week only because they were changing from one job to another. This group is very small—only 1 percent of all multiple jobholders in May 1969.
- <sup>2</sup> Data for all persons other than white are used in this report to represent data for Negroes, since the latter constitute about 89 percent of all persons other than white in the United States.

# **Explanatory note**

ESTIMATES in this report are based on supplementary questions in the May 1972 and 1973 monthly surveys of the labor force conducted and tabulated for the Bureau of Labor Statistics by the Bureau of the Census. The basic labor force concepts, sample design, estimating methods, and reliability of the data are described briefly in the material which follows.

#### **DEFINITIONS AND EXPLANATIONS**

Population Coverage. Each month trained interviewers collect information from a sample of about 47,000 households in 461 areas in 923 counties and independent cities with coverage in each of the 50 States and the District of Columbia. Estimates in this report are for persons 16 years of age and over in the civilian noninstitutional population during the calendar weeks ending May 13, 1972 and May 12, 1973. The civilian noninstitutional population excludes all members of the Armed Forces and inmates of institutions, such as homes for the aged and correctional institutions.

Employed. Employed persons are all those who during the survey week (a) did any work at all as paid employees or in their own business or profession, or on their own farm, or worked 15 hours or more as unpaid workers in an enterprise operated by a member of the family or (b) did not work but had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, labor-management dispute, or personal reasons, whether they were paid by their employers for the time off, or were seeking other jobs.

Occupation, Industry, and Class of Worker. The data on occupation, industry, and class of worker refer to the primary and secondary jobs held during the survey week. The primary job of a person employed at two jobs or more is the job at which he worked the greatest number of hours during the week.

The occupation and industry categories used here are those used in the 1970 Census of Population. The class-of-worker breakdown specifies "wage and salary workers," "self-employed workers," and "unpaid family workers." Wage and salary workers are persons working for wages, salary, commission, tips, payment in kind, or at piece rates for a private employer or any government unit. Self-employed workers are persons

working in their own unincorporated business, profession, or trade, or operating a farm, for profit or fees. Unpaid family workers are persons working without pay on a farm or in a business operated by a member of the household to whom they are related by blood or marriage.

Multiple Jobholders. For purposes of this survey, a multiple jobholder is an employed person who, during the survey week, (1) had a job as a wage or salary worker with two employers or more, (2) was self-employed and also held a wage or salary job, or (3) worked as an unpaid family worker but also had a secondary wage or salary job. A person employed only in private households (as a maid, laundress, gardener, babysitter, etc.) who worked for two employers or more during the survey week was not counted as a multiple jobholder. Working for several employers was considered an inherent characteristic of private household work rather than an indication of multiple jobholding. Also excluded were self-employed persons with additional farms or businesses and persons with any additional jobs as unpaid family workers. The primary job is the one at which the greatest number or hours were worked.

Hours of Work. The statistics on hours of work are for the actual number of hours worked during the survey week. For persons working in more than one job, information was obtained in this special study on the hours worked on the primary job and on the secondary job.

The total number of hours worked was obtained by adding hours reported separately for the primary job and the secondary job, rather than using the respondent's answer to total hours worked.

Full-Time and Part-Time Jobs. Full-time jobs are those at which persons worked 35 hours or more during the survey week, and part-time jobs are those at which persons worked 1 to 34 hours.

Earnings. Earnings on the primary job are the usual weekly money earnings (before deductions for taxes, etc.) received by workers in the form of wages and salaries (including commissions and tips).

Age. The age classification is based on the age of the person at his last birthday.

Race. The population is divided into three groups on the basis of race: white, Negro, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except white and Negro.

Marital Status. Persons are classified into the following categories according to their marital status at the time of interview: Single, married, spouse present, and other marital status. The classification "married,

spouse present "applies to husband and wife if both are reported as members of the same household even though one may be temporarily absent on business, vacation, on a visit, in a hospital, and the like at the time of interview. The term "other marital status" applies to persons who are married with spouse absent, widowed, or divorced.

Sums of Distribution. Sums of individual items, whether absolute numbers or percentages, may not equal totals because of independent rounding of totals and components. Percentage totals, however, are always shown as 100 percent.

#### RELIABILITY OF THE ESTIMATES

Estimating Procedure. The estimating procedure used in this survey inflates weighted sample results to independent estimates of the civilian non-institutional population by age, sex, and race. These independent estimates are based on statistics from the 1970 Census of Population and other data on births, deaths, immigration, emigration, and strength of the Armed Forces.

Variability. Since the estimates are based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same schedules and procedures. As in any survey, the results are also subject to errors of response and reporting. These may be relatively large in the case of persons with irregular attachment to the labor force.

The standard error is primarily a measure of sampling variability, that is, of the variations that might occur by chance because a sample rather than the entire population is surveyed. As calculated for this report, the standard error also partially measures the effect of response and enumeration errors but does not measure any systematic biases in the data. The chances are about 2 out of 3 that an estimate from the sample would differ from a complete census by less than the standard error. The chances are about 19 out of 20 that the difference would be less than twice the standard error.

The following examples illustrate their use. An estimated 987,000 multiple jobholders had at least one agricultural job in May 1973. Table 1 shows the standard error of 987,000 to be approximately 41,700. Chances are about 2 out of 3 that a complete census would have differed from the sample estimate by less than 41,700. Chances are 19 out of 20 that the difference would have been less than 83,400.

These 987,000 multiple jobholders were 23.2 percent of all moon-lighters in May 1973. Table 2 shows the standard error of 23.2 percent with a base of 4,262,000 to be about 0.9 percent. Consequently, chances are 2 out of 3 that a complete census would have disclosed the figure to be between 22.3 and 24.1 percent, and 19 out of 20 that the figure would have been between 21.4 and 25.0 percent.

The reliability of an estimated percentage, computed by using sample data for both numerator and denominator, depends upon both the size of the percentage and the size of the total upon which the rercentage is based. Estimated percentages are relatively more reliable than the corresponding absolute estimates of the numerator or the percentage, particularly if the percentage is large (50 percent or greater).

For a more complete description of the methodology, see Concepts and Methods Used in Manpower Statistics from the Current Population Survey (BLS Report 313).

Table 1. Standard errors of estimated numbers

(In thousands)
